Roofing Foreman Falls 19 Feet from Extension Ladder

SUMMARY
A 43-year-old roofing foreman died when he fell 19 feet from an extension ladder.

The foreman worked for a roofing contractor who occasionally did siding repair. He had overseen the company’s projects for five years.

The foreman and a company roofer were replacing siding on the wood chimney chase of a two-story house.

The roofer used a 24-foot extension ladder to access the roof at the rear of the house. The foreman then moved the ladder to the side of the house. He planned to place a fascia board on the upper part of the chase while standing on the ladder, with the roofer’s help. To do this he placed the base of the ladder between two raised garden beds and leaned the ladder against the chimney chase. This created a 65-degree angle, lower than a safe 75-degree angle. The ladder would have been nearly vertical if he had placed it on the other side of the garden bed.

He did not secure the ladder from movement at the bottom, or secure it at the top once he climbed up it. The roofer questioned him about the safety of the ladder setup, but the foreman replied it would be okay because the job would not take long.

From the roof, the roofer helped the foreman hold the board in place. The board was about 25 feet above the ground. Standing either on the second or third rung from the top of the ladder, the foreman used a drill to put a screw into the board. As he leaned to his right to put in another screw, the ladder slid sideways and he fell with it, landing 19 feet below on a concrete walkway. He died from multiple blunt force injuries.

REQUIREMENTS
• Secure the ladder at the top and bottom when working from it. See WAC 296-876-40040(2)
• Set up non-self-supporting ladders at a safe angle. The ladder is set at the proper angle when the horizontal distance from the top support to the foot of the ladder is approximately one-quarter the working length of the ladder. See WAC 296-876-40020(1)

RECOMMENDATIONS
FACE investigators concluded that, to help prevent similar occurrences:
• Keep your body centered between the ladder’s side rails. Do not overreach.
• Determine whether you can do a task safely using a ladder. If not, then use a safer alternative. Remember, even if it “will just take a minute,” using a ladder unsafely is always dangerous!
• Set ladders at a 75-degree angle to ensure the bottom of the ladder does not slide out, and so that the user is able to maintain their balance.
• Never work from the top three rungs of a straight, single, or extension ladder.
